

APC Integration provides smart mobile workforce management solutions using leading edge computer and mobile data technologies

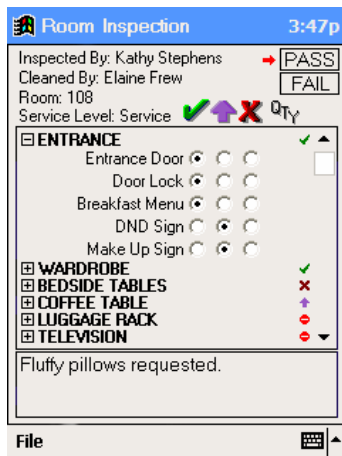

Rapid advances in hand-held computer, automatic identification and wireless communications technology have resulted in the potential to significantly improve the efficiency and traceability of tasks performed by the mobile workforce.

Powerful and compact hand-held computers are used to receive work instructions and enter information relating to tasks being performed. Integrated barcode and RFID scanning capability makes it easy to register location of tasks being performed, or ID of equipment being worked on.

Modern wireless communication systems, like Wireless LAN, GPRS and Next G provide efficient data transfer between mobile workers and business operations.

Key areas of benefit that the system provides are:

- **Efficient task allocation** - tasks are received on hand-held computers allocated to mobile workers, using real time wireless communication systems
- **Efficient location identification** - location of task being performed or ID of equipment worked on is verified by integrated barcode scanning or RFID.
- **Efficient data entry** - site / operation specific "soft" worksheets are completed by the mobile worker using the hand-held computer
- **Efficient data uploading** - "soft" worksheets are uploaded by wireless network to a central processing system
- **Efficient reporting** - reports are generated quickly and accurately using powerful report generation software

There are many applications across a spectrum of industries. Some examples are:

- Management and execution of equipment scheduled and breakdown maintenance
- Tracking of cleaning/servicing operations in the hospitality industry, with tedious manual data collection replaced with near real time electronic data collection and transfer
- Tracking of cleaning and food quality assurance operations in the food processing industry, where stringent hygiene requirements require strict control of cleaning and verification operations and HACCP accreditation is a significant advantage
- Harsh environment asset tracking; where assets are identified using RFID and secure asset identification is needed at the point of application
- Efficient tracking of product deliveries using electronic signatures for proof of receipt

Our commitment to excellence

APC Integration has an impressive business record gained by working with many successful and diverse organizations for over two decades. APCI is committed to prompt and efficient support from the system design, integration and commissioning phases through to operational use and associated maintenance and upgrades.

We welcome opportunities to discuss your requirements and work with you in delivering leading edge technology solutions.
